

PERIMETER BOUNDARY

The perimeter boundary is a good solution for closing off the perimeter of the storey conveniently and quickly. The Cofresa model is manufactured with square panels which provide greater rigidity. In addition, these are easy to join together, as they have tongues and grooves.

In order for any perimeter boundary to function correctly, it must be correctly anchored to the board using bolts. Do not use any components other than bolts for this, as they will not provide sufficient anchorage.

Standard heights: 300 mm., 350 mm.

Standard lengths: 2.000 mm., 1.000 mm. There is an "extendable" boundary which provides formwork for between 10 and 950 mm.

Extendable boundary.
